

Biokinetics' Helmet Testing Software (HTS) is an easy to use program specifically designed for helmet testing. The HTS interfaces directly with all of Biokinetics' helmet test equipment via PC-based data acquisition and motion control. Test screens specific to each laboratory apparatus are provided allowing you to perform pre and post-test instrument checks followed by the entire helmet test sequence. Test results are instantly displayed both numerically and graphically and the data are automatically saved to disk for review at a later date. Once testing is completed, the HTS generates a test report and easily allows data file storage.
